

APPARATUS AND SYSTEM FOR DISPLAYING RECEIPT OF A PACKET

ABSTRACT

1 *gm A1* A connection unit for a computer, which is
2 connectable to a network, is configured such that it
3 comprises: (a) means, responsive to receipt by the
4 connection unit of a predetermined packet via the
5 network, for generating a predetermined signal; and (b)
6 means, responsive to the predetermined signal, for
7 displaying the receipt of the predetermined packet. With
8 these means, a user of said computer is enabled to
9 recognize the fact that execution of WOL has been carried
10 out or attempted, without running a specific application
11 (adapted for informing the user of the fact that WOL was
12 executed) on the computer, or even where the computer is
13 not connected to the connection unit.
